

Lab Assignment 10

Keira Wong

ISSUE

Saving Items to the Database

Initially, I was losing the items I added to the todo list after rerunning my program. It turns out that this is because our application uses the `UseInMemoryDatabase` rather than an actual database. It was because of this reason that items were lost after starting the program with IIS Express.

Startup.cs

```
23 | services.AddDbContext<TodoContextKw>(opt =>  
24 |                                     opt.UseInMemoryDatabase("TodoList"));
```

SOLUTION

The solution we found was to start the program using the “Start without Debugging” option before adding items to the todo list so that when the program was run for a second time using the same “Start without Debugging” option, the items which were previously added were still present.
